Section 1: Coding

1. Problem Statement

You are a software developer tasked with building a module for a scientific calculator application. The primary function of this module is to convert infix mathematical expressions, which are easier for users to read and write, into postfix notation (also known as Reverse Polish Notation). Postfix notation is more straightforward for the application to evaluate because it removes the need for parentheses and operator precedence rules.

The scientific calculator needs to handle various mathematical expressions with different operators and ensure the conversion is correct. Your task is to implement this infix-to-postfix conversion algorithm using a stack-based approach.

Example

Input: a+b

Output:

ab+

Explanation:

The postfix representation of (a+b) is ab+.

Input Format

The input is a string, representing the infix expression.

Output Format

The output displays the postfix representation of the given infix expression.

Refer to the sample output for formatting specifications.

struct Stack* createStack(unsigned capacity) {

Sample Test Case

Input: a+(b*e)

```
Output: abe*+

Answer

#include <stdio.h>
#include <stdlib.h>
#include <string.h>
```

```
struct Stack {
  int top;
  unsigned capacity;
  char* array;
};
```

```
struct Stack* stack = (struct Stack*)malloc(sizeof(struct Stack));

if (!stack)
```

```
return NULL;
                                                                                 241501051
       stack->capacity = capacity;
       stack->array = (char*)malloc(stack->capacity * sizeof(char));
       return stack;
     }
     int isEmpty(struct Stack* stack) {
       return stack->top == -1;
     }
                                                                                 24,150,105,1
return stack->array[stack->top];
     char pop(struct Stack* stack) {
       if (!isEmpty(stack))
         return stack->array[stack->top--];
       return '$';
     }
     void push(struct Stack* stack, char op) {
       stack->array[++stack->top] = op;
                                                      24,150,1051
     #include<ctype.h>
    int isOperand(char ch) {
       return isalnum(ch);
     int Prec(char ch) {
      switch (ch) {
         case '+':
         case '-':
           return 1;
         case '*':
         case '/':
return
case '^':
ret
                                                                                 241501051
                                                      24,150,1051
         return 2;
           return 3;
```

```
24,150,1051
                                                         24,150,105,1
       return -1;
     void infixToPostfix(char* exp) {
       struct Stack* stack = createStack(strlen(exp));
       if(!stack) return;
       for(int i = 0; exp[i]; i++) {
          char ch = exp[i];
          if(isOperand(ch)) {
else if(ch == '(') {
    push(stack)
}
            printf("%c", ch);
                                                                                      24,150,105,1
            push(stack, ch);
          else if (ch == ')') {
            while (!isEmpty(stack) && peek(stack) != '(')
               printf("%c", pop(stack));
            if (!isEmpty(stack) && peek(stack) != '(')
              return;
            else
               pop(stack);
          }
          else {
            while (!isEmpty(stack) && Prec(ch) <= Prec(peek(stack)))
               printf("%c", pop(stack));
            push(stack, ch);
       while (!isEmpty(stack));
          printf("%c", pop(stack));
       printf("\n");
       free(stack->array);
       free(stack);
                                                                                      24,150,105,1
                                                         241501051
```

```
int main() {
    char exp[100];
    scanf("%s", exp);

    infixToPostfix(exp);
    return 0;
}
```
